

# Why use context managers?

They're pretty and safe is why!

- You can't forget to close resources.
- They can make code much prettier.
- They can make complex logic simpler.

# Why use context managers?

`contextlib.suppress`

```
def kill_process(pid):  
    # Kill a process, ignore if it can't be found.  
    with contextlib.suppress(ProcessLookupError):  
        os.kill(pid, signal.SIGKILL)
```

*# Nicer than:*

```
def kill_process(pid):  
    try:  
        os.kill(pid, signal.SIGKILL)  
    except ProcessLookupError:  
        pass
```
