

```
class FoodContextManager:
    def __init__(self, data):
        self.data = data

    def __enter__(self):
        print(f"Enter: {self.data}")
        return self.data

    def __exit__(self, *exc):
        print(f"Exit: {self.data}")

with FoodContextManager({"dairy": "yuck"}) as data:
    data["fruit"] = "delicious"
```

“Boy, that sure was a lot of work”

— Me when I first wrote a context manager this way
