Why use context managers?

ThreadPoolExecutor - Good version!

```python
data = {
    "Fruit": "spectacular",       # Spinach is delicious!
    "Dairy": "yucky",             # Fruit is spectacular!
    "Meat": "not cool",           # Dairy is yucky!
}                                 # Meat is not cool!

def make_a_sentence(noun, adjective):
    return f"{noun} is {adjective}!"
```
